

Create a flow with on-premise apps

Create flows that have on-premise as well as cloud app triggers and actions.

You can follow these generic steps to set up a flow with on-premise app trigger and actions:

1. [Create an on-prem agent in Zoho Flow.](#)
2. [Install and run the on-prem agent in your local machine.](#)
3. [Create a new flow](#), then select an [app for the trigger](#). (If you choose an on-premise app, then connect to the app using the agent created)
4. [Proceed to add more actions](#). They can be actions of on-premise apps or cloud apps. (When you select an on-premise app, you need to create a new app connection using the agent created.)
5. [Test the flow](#). If everything looks good, [switch the flow on](#).
